

# RHEL 3.9 vsftpd bug

The `vsftpd` version 1.2.1-3E.12 delivered with the RedHat Enterprise Linux 3.9 update creates files with wrong, insufficient access rights. Please avoid using this version of `vsftpd`. An unofficial bug fix is available from RedHat or Riege Software on request.

FTP is a legacy protocol to transfer files between hosts. Riege Software encourages customers to use `scp` or `sftp` instead of `ftp` to improve system security.
